AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (Original) System for exchanging voice-packets via an Internet Protocol and comprising a first terminal (1) for transmitting said voice-packets via a network (3) to a second terminal (2) for receiving said voice-packets, which voice-packets form part of a call, characterised in that said network (3) comprises a storage-station (4) for storing information to be supplied during said call to said second terminal (2) in the form of at least one data-packet via the Internet Protocol in response to at least one trigger-packet originating from said first terminal (1) via the Internet Protocol.

2. (Original) System according to claim 1, characterised in that said voice-packets comprise at least audio, with said data-packet comprising at least video.

3. (Currently Amended) System according to claim 1 ~~or 2~~, characterised in that said trigger-packet is sent from said first terminal (1) to said storage-station (4).

4. System according to claim 3, characterised in that said information comprises information-parts, with said trigger-packet comprising an indication for selecting at least one information-part to be supplied during said call to said second terminal (2).

5. (Currently Amended) System according to claim 1 or 2, characterised in that said

trigger-packet is sent from said first terminal (1) to said second terminal (2), with said second

terminal (2) in response to said trigger-packet generating a further trigger-packet to be sent

during said call to said storage-station (4) via the Internet Protocol.

6. (Original) System according to claim 5, characterised in that said information

comprises information-parts, with said trigger-packet and said further trigger-part comprising an

indication for selecting at least one information-part to be supplied during said call to said

second terminal (2).

7. (Original) First terminal (1) for use in a system for exchanging voice-packets via

an Internet Protocol and comprising said first terminal (1) for transmitting said voice-packets via

a network (3) to a second terminal (2) for receiving said voice-packets, which voice-packets

form part of a call, characterised in that said network (3) comprises a storage-station (4) for

storing information to be supplied during said call to said second terminal (2) in the form of at

least one data-packet via the Internet Protocol in response to at least one trigger-packet

originating from said first terminal (1) via the Internet Protocol.

8. (Original) Second terminal (2) for use in a system for exchanging voice-packets

via an Internet Protocol and comprising a first terminal (1) for transmitting said voice-packets via

a network (3) to said second terminal (2) for receiving said voice-packets, which voice-packets

form part of a call, characterised in that said network (3) comprises a storage-station (4) for

storing information to be supplied during said call to said second terminal (2) in the form of at

least one data-packet via the Internet Protocol in response to at least one trigger-packet

originating from said first terminal (1) via the Internet Protocol.

9.   (Original) Storage-station (4) for use in a system for exchanging voice-packets via

an Internet Protocol and comprising a first terminal (1) for transmitting said voice-packets via a

network (3) to a second terminal (2) for receiving said voice-packets, which voice-packets form

part of a call, characterised in that said network (3) comprises said storage-station (4) for storing

information to be supplied during said call to said second terminal (2) in the form of at least one

data-packet via the Internet Protocol in response to at least one trigger-packet originating from

said first terminal (1) via the Internet Protocol.

10.   (Original) Method for use in a system for exchanging voice-packets via an

Internet Protocol and comprising a first terminal (1) for transmitting said voice-packets via a

network (3) to a second terminal (2) for receiving said voice-packets, which voice-packets form

part of a call, characterised in that said network (3) comprises a storage-station (4) for storing

information, with said method comprising the step of supplying said information during said call

to said second terminal (2) in the form of at least one data-packet via the Internet Protocol in

response to at least one trigger-packet originating from said first terminal (1) via the Internet

Protocol.
